
FAILURES IDENTIFIED
MITIGATIONS
Provenance failure
At low coverage, models cite a real, on-topic paper that does not contain the specific claimed fact — not an outright fabrication.
Retrieval + support verification
Check existence, record identity, and confirm support
Full-text-grounded citing
Abstain when coverage is low or support is unverifiable
Behavioral bias
Models infer resource scarcity from a patient's nationality and change an otherwise-invariant recommendation.
State the resource setting
Give the care context explicitly in the prompt (low-cost control)
Counterfactual invariance audit
Swap nationality and flag any divergence before deployment
ACROSS BOTH
Score hallucination by whether a citation supports its claim, not merely exists · stratify evaluation by literature coverage and geography · build participatory, equity-focused benchmarks
